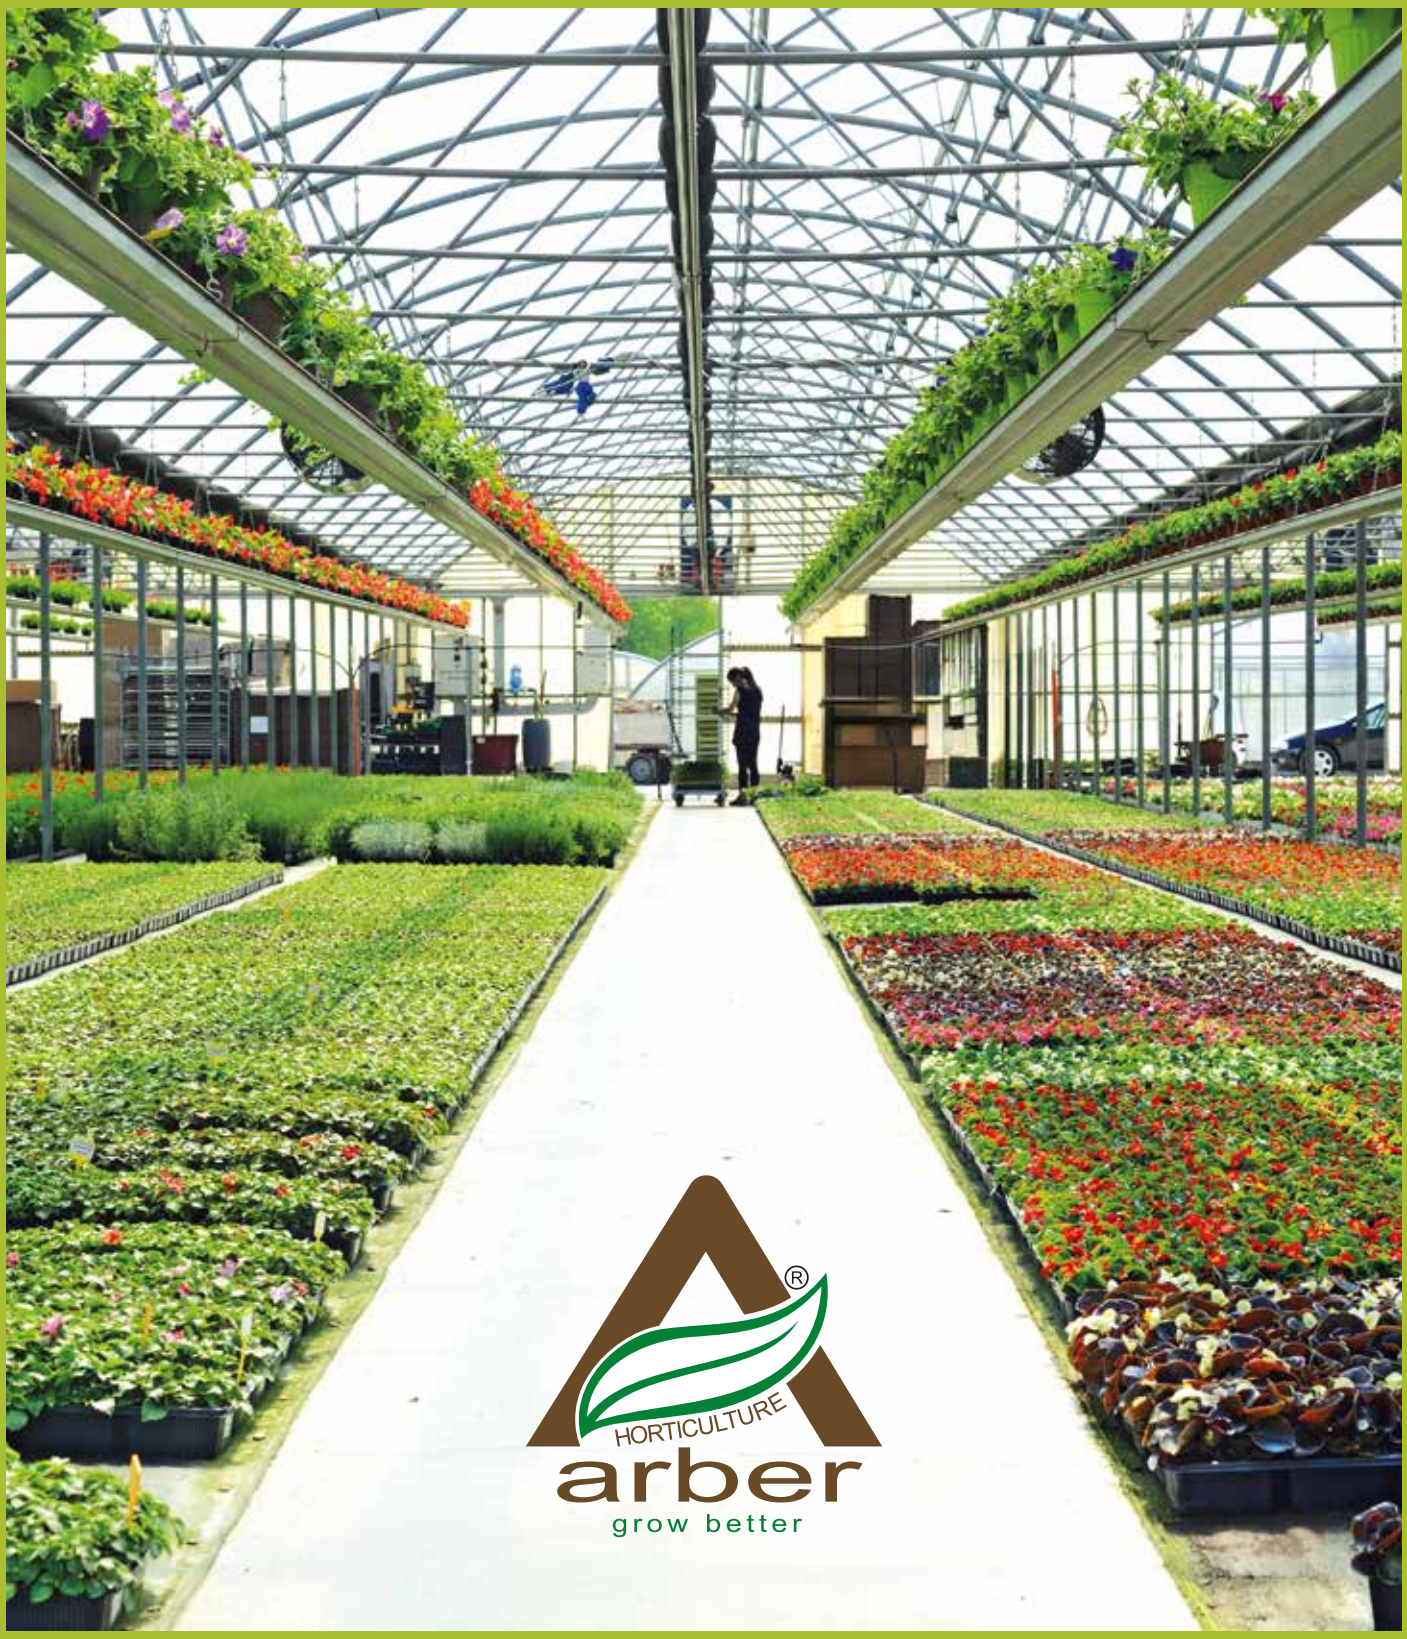
PROFESSIONAL LINE

High-quality professional cultivation substrates



Why Arber?

Arber is the surname of British scientist **Agnes Robertson** Arber, an anatomist and plant morphologist, philosopher of biology, and historian of botany. She became well-known for her significant contributions to scientific research, initially focused on monocotyledon flowering plants. She also contributed to morphological research and botanical studies. In the latter part of her life, her work focused on the philosophy of botany, particularly the nature of biological research.

We chose the name Arber for our company because, like Agnes Arber, our **passion for horticulture** is the guiding star of our daily commitment to clients and stakeholders.

Our Story

Our company was founded in 1996 from the founder's passion for horticulture and botany, which led to the creation of **Sudest Europe:** a family-run business that is now a leader in the sale of both hobbyist and professional substrates for horticulture and floriculture.

In 2016, we **rebranded** as **Arber Horticulture** for two main reasons. Firstly, to express our passion and commitment to horticulture: the name Arber is inspired by Agnes Arber, one of the world's most important botanists. Secondly, the rebranding from Sudest Europe to Arber Horticulture reflects our broader business scope: from an Italian-based company originally named Sudest Europe, reflecting its location in Southeast Europe operating mainly in the local market, to a company now selling products worldwide.

Arber Horticulture is fully dedicated to helping growers achieve the best results in their horticultural production. What sets us apart is the **quality** of our products and our **customer orientation**.

Customer Orientation

Together with our partners, we strive to ensure ongoing **technical research** and the **best customer support** for growers. Arber products are created to provide optimal formulas and technologies to meet our customers' horticultural production needs.

The quality

Arber Horticulture produces and markets a full range of substrates for horticulture and biomass. Our peat bogs and processing facilities, mainly located in the **Baltic countries and Germany**, have quality management systems aligned with **ISO 9001** standards and comply with European regulations, as members of the European Peat and Growing Media Association (**EPAGMA**).

Italy						✓		✓

Sustainability

Arber Horticulture is committed to **environmental protection**. One of our goals is the responsible use of natural resources and to promote sustainable peat extraction. We work with our partners to support wetland restoration and compliance with modern quality management standards.

Our professional substrates

Thanks to their excellent chemical, physical, and biological properties, white and/or black sphagnum peat is the main component of our substrates. Other components are added based on specific cultivation goals. Our over 500 formulas have been developed and tested to provide high-quality, reliable products for professional growers. Our flexible production system also allows us to create **custom mixes** on request

7M m³ of substrates sold since 1996

Clients in 20+ countries

News

Mus-RK1

Cover substrate for champignon mushrooms, promoting vigorous mycelium growth with compact fungi and high yields in all harvest cycles.
Discover it on page 17.

Growbags

Grow bags with plastic coating and holes for the production of tomatoes and other vegetables.
Discover it on page 24.

AR Containermulch

Innovative blend of wood fiber and thermally sanitized wood chips, designed to function both as mulch in pots and garden beds.

Mulches

AR Containermulch

70L
Q./plt
42

Big Bale
Q./plt
1

AR Containermulch is an innovative blend of wood fiber and thermally sanitized wood chips, designed to function both as mulch in pots and garden beds. Thanks to its light and breathable structure, it creates a **protective layer that drastically reduces water evaporation**—a crucial advantage during the hotter months and in pots—and **effectively hinders the growth of weeds**, keeping the surrounding area clean and tidy.

Beyond its main functions, AR Containermulch acts as **thermal insulation**, protecting roots from temperature spikes and promoting denser, more vigorous root development. Over time, it **naturally decomposes**, returns nutrients to the soil, and helps reduce erosion on sloped land. Plants mulched with AR Containermulch also offer an attractive visual impact at points of sale and support more sustainable management by reducing the need for chemical herbicides.

For optimal application, it is recommended to spread a uniform layer of 2–3 cm on the pot or cultivation soil.

Vermiculite

100L

Q./plt
33

Arber Vermiculite is a naturally occurring mineral that is thermally expanded, ideal for improving water retention, aeration, and root protection in professional cultivation. **Thanks to its layered structure, it holds water and nutrients, releasing them gradually to promote balanced plant growth**.

Vermiculite is lightweight, stable, and chemically inert, **free from pathogens and toxic substances**, making it an excellent choice for horticulture, seed germination, and cutting rooting.
Advantages of Arber Vermiculite:
- Dust-free
- High water retention with gradual moisture release
- Improves aeration and root protection
- Lightweight, stable, and durable material
- 100% natural and pathogen-free
- Ideal for professional substrates and plant propagation
- Consistent production and regular deliveries

Available granulometries: 0-2 mm and 0-4 mm

Additives

Oxywet Material made from high-quality Swedish clay, free of contaminants such as heavy metals, sodium, chloride, and dioxins. It is used as a **natural wetting agent** in substrates to keep peat moist and distribute water throughout the substrate. This increases oxygen levels in the lower parts of the container, facilitating the growth of horticultural and floricultural crops.

Micromax It is a **slow-release fertilizer** with a nutrient duration of up to 18 months. It is designed to fully optimize the effectiveness of micronutrients and macronutrients and is recommended for the cultivation of all types of plants.

Potmix Additive easy to mix with peat and other substrate components. It helps improve **retention and the gradual release of fertilizers and water**. Additionally, it **normalizes pH and absorbs harmful** substances such as toxins, pathogens, and/or heavy metals.

Glossary

Peat Peat is a deposit of waterlogged plant remains and forms in soils saturated with water in the absence of oxygen and hydrogen. It is especially combined with garden and vegetable soil because, being acidic and fibrous, it makes the soil light and soft. Peat is classified into blonde, brown, and black types. Blonde peat is extracted from the upper layers of the peat bog and is minimally decomposed, while **brown and black peat** are taken from deeper layers and have a medium to high degree of decomposition. Blonde peat is characterized by greater fibrosity and porosity, whereas brown and black peat have higher density and water retention capacity. **Products containing 90–100% high-quality peat currently represent the most effective solution for the most demanding professional and hobbyist growers.**

Coconut fiber Material used in hydroponic cultivation obtained by removing fine dust from coconut husk. It promotes **root development** and, although it retains air even when fully saturated, it **dries** more slowly than many other substrates used in soilless cultivation.

Cocopeat Substance extracted from the pith inside the coconut shell. Its **antifungal properties** make it a good substrate for seed Seeding. Coconut peat is also used as a soil amendment, soaking mixture, and in hydroponic production.

Perlite Inorganic mineral of volcanic origin, with a color varying from gray to pink, and a porous, rounded shape. Expanded perlite is obtained through a thermal expansion process during which granules form inside, providing high lightness and good physical properties for use in agriculture, in soils, potting mixes, and as is. Expanded perlite is therefore used both as a soil amendment and as a **corrective in cultivation substrates**, helping to recreate an ideal habitat for the life cycle of every plant. Thanks to its porous structure, it allows the production of well-draining soils and mixes that enable continuous gas exchange with the external environment. Finally, expanded perlite **protects plant root systems** from temperature fluctuations by maintaining a constant temperature, thereby promoting normal crop development.

Vermiculite Material capable of **improving substrate aeration**. It does not deteriorate or rot and can protect seeds and young plants from fungal attacks.

Volcanic Lapillus Eco-friendly volcanic granules with **excellent mulching** and weed control properties, suitable for use in gardens, parks, and flower beds. Its uniform granulometry allows for easy application, reducing installation time while delivering particularly appealing aesthetic results. The micro-porosity of the granules provides good **thermal insulation**, while its capacity to store water reserves helps **reduce soil drying**. The intense color also serves a decorative purpose. Being a hygroscopic product, it may experience variations in weight.

Pumice Pumice is the result of the expansion of effusive magmatic mineral, producing a highly porous and notably lightweight material. It has great **water retention capacity and releases liquids slowly**. This is a completely natural and ecological product suitable for floricultural applications, where it is already widely used.

Vulcamix Vulcamix is a ready-to-use product, easy to apply, free from harmful substances and weed seeds, which effectively replaces silica sands in the **treatment and replenishment of turfgrass** (top dressing). It helps create lawns suitable for intensive use (up to 500 hours/year) by promoting the **development of root systems**. It is also ideal for vertidrain operations as a corrector of the soil's chemical and physical characteristics.

Clay It appears in the form of small pebbles made of baked clay. Expanded clay is a porous medium that is extremely favorable for the **development of the plant's root system**.

Calcareous pH corrector Material used to **increase the pH** of a substrate.
